

The Trauma Prevention Foundation

Objectives, Overview and Strategy.

Nikhil Misra,

Consultant General and Trauma Surgeon,
Aintree University Hospital, Liverpool.

The Trauma Prevention Foundation

BACKGROUND

Trauma – What is the problem?

- The commonest cause of death in the UK from the ages of 1 to 40.
- For every death, there are 2 people who incur a permanent disability.

	External	Cancer	Circulatory	Respiratory	Other
Age	1st	2nd	3rd	4th	5th
1-4	Perinatal & congenital	Influenza and pneumonia	Brain cancer	Meningitis and meningococcal infection	Vaccine preventable disease
5-19	Suicide	Transport accidents	Homicide	Leukaemia and lymphomas	Brain cancer
20-34	Suicide	Accidental poisoning	Transport accidents	Homicide	Cirrhosis and other liver disease
35-49	Suicide	Heart disease	Accidental poisoning	Cirrhosis and other liver disease	Stroke
50-64	Heart disease	Lung cancer	Cirrhosis and other liver disease	Colorectal cancer	Chronic lower respiratory diseases
65-79	Heart disease	Lung cancer	Chronic lower respiratory diseases	Stroke	Prostate cancer
80+	Dementia and Alzheimer's disease	Heart disease	Influenza and pneumonia	Stroke	Chronic lower respiratory diseases

Gun and Knife Trauma at A Major Trauma Centre: Recidivism and Creation of a Trauma Map

Authors: R Weatherburn, R McDonald, J Malone, J Smith, R Lawrence-Owen, RG Ward, N Misra

Unit: Emergency General Surgical Unit, University Hospital Aintree Consultant: Mr. N Misra Session: HST

Introduction:

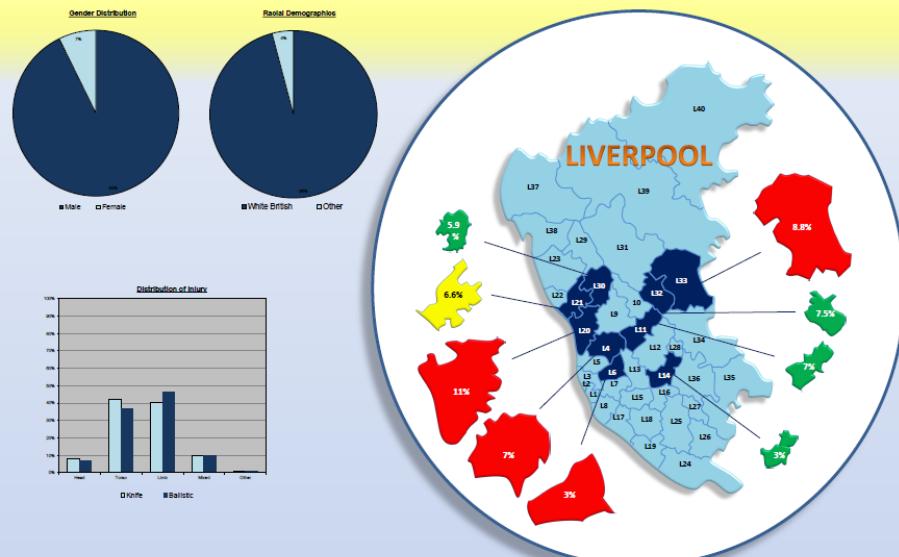

University Hospital Aintree is the appointed trauma centre for Mersey and North Cheshire. The sphere of influence embraces areas of Liverpool with high crime and deprivation rates. American studies have identified a correlation between recidivist rate, defined as repeated presentations to hospital with traumatic injuries, and local crime rates, providing a large burden on the provision of care¹. These studies found that after the implementation of community based programs the recidivist rate decreased² by more than 50%³. Currently no UK Trusts have released data on recidivist rates. This study focussed on the presentation of ballistic and knife injuries to UHA over a 5 year interval to determine the recidivist rate and whether the implementation of intervention programs would be of benefit.

Method:

Retrospective observational study of patients who presented to UHA between 2009-2013. Clinical and demographic data was collected including registered postcodes of residence. The results were analysed to create a geographical representation of the incidence of trauma, and compared to council data on geographical incidence of social deprivation and crime.

Results:

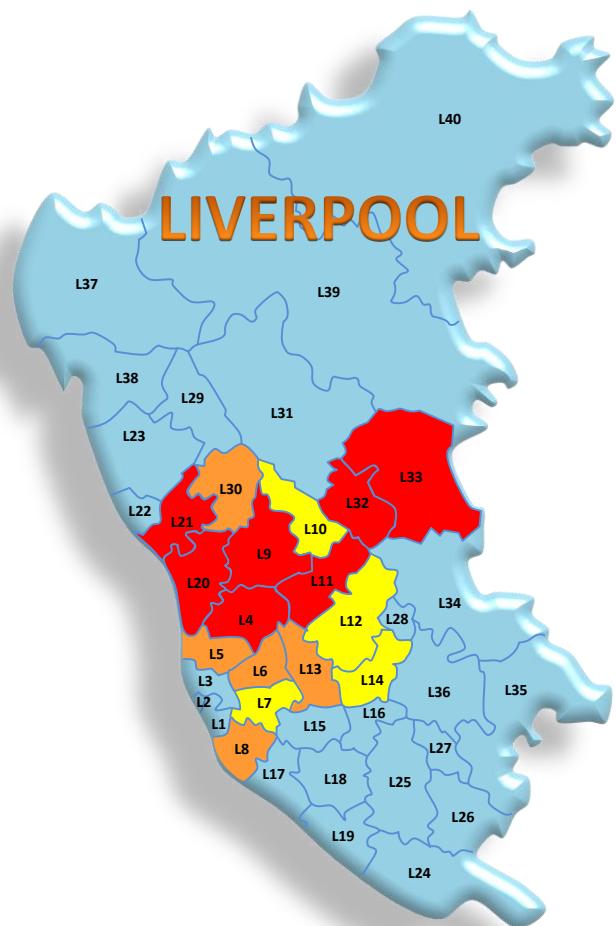

454 patient were identified, of these 362 sustained knife trauma and 93 sustained ballistic trauma. The average age was 28.6 and a 12½:1 male:female ratio was identified. The overall mortality rate was 0.4% and recidivist rate was 0.7%.

Conclusion:

Mortality and recidivism rates are lower than American reports. Postcode specific trauma presentations correlate with areas of high crime. As in American studies⁴ common demographic characteristics have been identified. These results support the development and implementation of community based programs to reduce trauma and crime rates.

Clinical

Data and Analysis

Local Authorities

Objectives

- Trauma Observatory
- Prevention via Education

Overview

- Reduce incidence and mortality from major trauma in Merseyside.
 - Identify and analyse patterns and trends of major trauma.
 - Identify at risk groups for various traumatic injuries and inform novel and existing trauma prevention intervention.
 - Dashboards providing ‘real-time’ trauma data.
 - Identify emergence of new patterns of injury, and monitoring existing known patterns of trauma.
 - Findings distributed to the relevant agencies to inform trauma prevention initiatives.
 - Focus on knife related trauma, falls and RTCs initially.

ROAD TRAFFIC COLLISIONS

Road traffic accidents kill, and the number of incidents is rising in Merseyside.....

2010

467
Incidents

2016

599
Incidents

A study was conducted by the Trauma Prevention Foundation and Merseyside Police looking at all the factors involved in fatal road traffic incidents between 2013 and 2016 in Merseyside.....

78% of fatal incidents occurred in fair weather conditions.

Only 1% Fatal incidents occurred in dark conditions with no lighting.

Only 12.5% Incidents involved alcohol

But also.....

30%

30% deaths due to speeding

36%

36% deaths were due to dangerous driving

34%

34% deaths due to driver error.

These factors were preventable.

It takes just one moment to stop and think....
And that will help prevent people dying on our roads.

Just One Moment...

Thank You.
