

MONTHLY BULLETIN: OCTOBER 2013 TO SEPTEMBER 2014

This bulletin provides a breakdown of injury attendances to Alder Hey Children's Hospital Emergency Department (ED) between October 2013 and September 2014.

Over the twelve month period there were 17,189 ED injury attendances. The month with the highest number of attendances, calculated as a daily average, was June 2014 (59 per day) compared to December 2013, the month with the fewest (33 per day; **Figure 1**)

For each month there were more male (56%) injury attendances than female presenting at Alder Hey ED (**Figure 1**). Patients aged between 10 and 14 years represented the largest proportion of injury attendances (35%), followed by those aged five years and under (34%; **Figure 2**).

The majority (94%) of injury attendances between October 2013 and September 2014 were recorded as other injury (**Table 1**). This can cover incidents such as a body injury or laceration.

Table 2 illustrates the incident location of other injuries only. Over a third (36%) of other injuries occurred in the home while 18% occurred in an education establishment and 12% occurred in a public place.

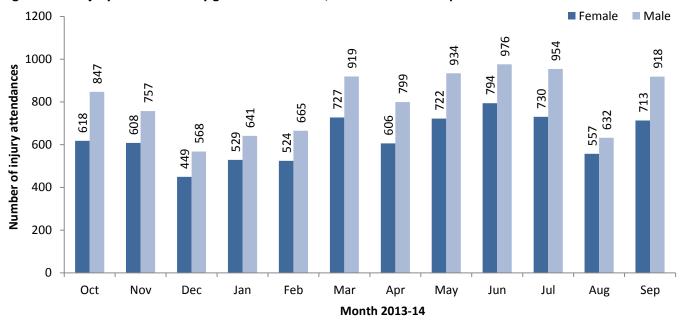

Table 3 illustrates the discharge method of injury attendances. Two-thirds (66%) of all injury attendances were discharged with no follow-up treatment required. Over one in ten (12%) were referred to the fracture clinic and 8% were referred to the re-dressing clinic.

Assault attendances

Between October 2013 and September 2014 there were 148 assault attendees presenting at Alder Hey Children's Hospital ED.

Attendees were mainly male (74%) and aged between 10 and 14 years (63%). The primary assault location was recorded as a public place (36%).

Figure 1: ED injury attendances by gender and month, October 2013 to September 2014^

[^] There were <5 records where the gender was unknown; these have been omitted from the chart.
